Anue Water Technologies launch new geomembrane covers

ANUE Water Technologies is launching customizable Geomembrane coverings for outstanding odour elimination in aquaculture and other industrial and municipal markets throughout the USA, Canada and the Caribbean region.

This technology consists of high strength geomembranes fitted with pockets that contain replaceable filter media, custom engineered to fit each application and ensure exceptional broad-spectrum odour control. It can be used in practically any application, such as tanks, sludge pits, open channels, vessels, fowl offal, truck bays, vertical vents, and fugitive emissions from vent covers. The technology was commercialized in 2011 and is already proven with use in 11 countries by major companies and municipalities. This includes use in industrial, municipal, and food and beverage applications.

The filters are designed to remove all odours, including those from difficult sulfide and ammonia. The system eliminates the need for costly chemicals or scrubber equipment,

and greatly reduces labour touch and OSHA risks, paying for itself within 6 – 12 months.

Anue VP General Manager Greg Bock stated: 'Anue is pleased to introduce this innovative, thoroughly tested and proven technology in the US, Canada and Caribbean region. These geomembranes provide many more municipal

and industrial customers an even lower-cost approach to sustainable odour control. This broadens Anue's product line to a wider range of odour control solutions.'
